Subject: Application for role

Dear Hiring Team,

I am writing to express my strong interest in joining your team. My background is in computer vision, machine learning, and building practical software that solves real problems. Rather than just relying on pre-packaged tutorial datasets or safe environments, my approach has always been simple: if the tools or data do not exist to solve a problem locally, I go out and build them myself.

A big part of my professional foundation comes from my time at the **State Bank of Pakistan (SBP)**. Getting selected for an internship at the central bank gave me direct exposure to how high-level institutions operate, collaborate, and maintain standards. During my tenure there, I worked closely with teams to help remodel one of their internal services and supported major organizational events. Experiencing that level of responsibility and institutional structure taught me workplace discipline, accountability, and how to deliver results in a professional environment.My hands-on technical work began during my internship at LA Consulting Corp, where I learned how computer vision works in practice. That experience led directly into my university Final Year Project: an Intelligent Traffic Violation Detection System. Because there were no public datasets reflecting local Pakistani road and traffic conditions, I took a camera around Karachi myself, recording footage and hand-labeling thousands of custom images to train our detection models. In addition to this, I currently work as a remote research intern for the Global Centre for Rehumanising Democracy (GCRD), conducting research for their Digital Democracy Index to evaluate how digital platforms and governance impact public discourse.

I also have a strong track record of building working software under tight deadlines. I have competed across multiple hackathons, securing 3rd place at the Al-Khair Hackathon, 5th place at the IBA Hackathon, and reaching Phase 2 with a Gold badge in Google AI Seekho. Most recently, our team qualified for the National Finals of the **Alibaba Cloud AI Hackathon Pakistan 2026**—making the top 300 out of over 16,000 applicant teams nationwide and earning full sponsorship to present our prototype live in Islamabad.

I am never afraid to tackle unfamiliar tools or step outside my comfort zone. If you give me a task, I will do the research, learn whatever framework is needed, and find a way to get it done properly. I would welcome the opportunity to discuss how I can contribute to your engineering team. Thank you for your time and consideration.

Sincerely,

Syed Muhummed Shariq
